

Flexible Collection Curation with MyCollections 4.0

MyCollections, the easy-to-use app for cataloging and sharing your collections, has been flexible new tools for customizing the way your collections are displayed.

Whether you're using the [MyCollections app](#) for iOS, Android, Windows, or the web, the MyCollections 4.0 make it even easier to show off your collections exactly as you'd like

Add More Details to Your Collections

There are several new features in MyCollections 4.0 that make it easier to enter collections and fine-tune the display of your collections:

- Support for adding custom introductory text when you publish a collection
- Links in introduction and text fields will be detected and automatically be clickable
- When publishing an update to a public collection, the old URL will automatically create a new collection
- Support for searching in published collections – both within the app and on the web
- New button to duplicate a record

When making a collection public, it's now possible to add some introductory text to describe the collection. In addition, for all collections (private, shared with friends, or made public) any email address you add will be automatically detected and will be clickable.

Below, I've added a short introduction to my Books collection as well as an email address using the mailto: convention. When the collection is published, viewers will be able to tap the email
