

widgets.py

```
from django.forms.extras.widgets import MultiWidget

class AddressWidget(MultiWidget):
    def __init__(self, attrs=None):
        widgets = (TextInput, TextInput)
        super(AddressWidget, self).__init__(widgets, attrs)

    def decompress(self, value):
        """
        If called, value is a string should return a list
        """
        if value:
            # parse stuff and return a list
            return value.split()
        return [None, None]
```

Two TextInput
widgets!!!
