

Easy views.py

```
def my_view(request, template_name='myapp/my_form.html'):

    # sticks in a POST or renders empty form
    form = MyForm(request.POST or None)
    if form.is_valid():
        do_x()
        return redirect('home')
    return render(request, template_name, {'form': form})
```

- **6 lines of code instead of 9**
- 33.3333333333% less code to debug
- One form instantiation
- **less conditionals == less edge case insanity**
