

These **ward level well-being scores** present a combined measure of well-being indicators based on 12 different measures. Where possible each indicator score is compared with the England and Wales average, which is zero. **Scores over 0 indicate a higher probability that the population on average experiences positive well-being** according to these measures. **Users can adjust the weight** of each indicator depending on what they consider to be the more or less important. This is done either by entering a number between 0 and 10 in the importance row or by moving the slider. The scores throughout this spreadsheet will update automatically.

[illegible]

Numbers highlighted in green are wards in top 25%, and red in bottom 25%

Average
change (green
significantly
improving, red
significantly
reducing)
