

Graphing the Discrete and Continuous Functions

Determine whether the graph will be discrete or continuous. Complete the table. Graph the function.

- 1 Each day that a library book is kept past its due date, a \$0.75 fee is charged. The total cost of the fees can be represented by the equation $f(x) = 0.75x$. Is the function discrete or continuous?

- 2 Strawberries are being sold for \$2 per pound. The total cost of the strawberries can be represented by the equation $f(x) = 2x$. Is the function discrete or continuous?

- 3 Cans of dried tomatoes weigh 25oz each. If a person is purchasing cans of dried tomatoes, the total weight in ounces can be represented by the equation $f(x) = 25x$. Is the function discrete or continuous?

- 4 In a salad with vegetables containing 10 calories dressing is added at 100 calories per ounce. The total number of calories can be represented by the equation $f(x) = 100x + 50$. Is the function discrete or continuous?

- 5 Cans of chicken noodle soup are on sale for \$0.89 each. The total cost of cans of soup can be represented by the equation $f(x) = 0.89x$. Is the function discrete or continuous?

- 6 My stopped to get gas before going on a road trip. The tank already had 2 gallons of gas in it. The total amount of gas can be represented by the equation $f(x) = x + 2$. Is the function discrete or continuous?
