

Around 1000 Kg of earth is mined to extract 5 gram (or 25 carat) diamonds. And out of total extracted diamond, only 20% is of gem quality (i.e. used in jewelry) and remaining 80% is used for industrial purpose.

Chances of extracting 1 carat diamond is 1 in 1,000,000 and of 2 carat diamond is 1 in 5,000,000.

If all the diamonds ever polished since the beginning of time were to be gathered, they would fill only one double-decker bus.
