

Execute    Debug   

EXISTS.sql - csbisom..nd (UNCW\klined (63)) × ORDERBY.sql - csbisom..nd (UNCW\klined (64))

```
JOIN Products ON Products.CategoryID = Categories.CategoryID

-- note that we need to use DISTINCT to remove duplicates
-- so why not always use the JOIN version?
-- well, notice we don't really need to get any
-- fields from the Products table
-- it's only there to figure out which categories to show
-- consider a case where there are 20 billion products
```
