How do animals
change as they grow?

Year 2

Useful words

transform
teenager
wrinkles

No animal begins its life fully grown. If you look around you in the spring, you might see tadpoles, caterpillars and chicks. These are the baby versions of animals. These baby animals soon grow up to be much larger. Some creatures, such as butterflies and frogs, look completely different when they are young. Even humans change dramatically as they get older. If you look at your baby brother and your grandfather, you will spot a lot of differences!

In this booklet, join Cornelia the Caterpillar, Charlotte the Chick and the Grandpas as they help you learn about how we change with age!

Questions

1. Tick the three topics covered in this booklet.
☐ Caterpillar to butterfly ☐ Chick to adult
☐ Baby to elderly person ☐ Egg to chicken
2. Which creatures look very different when they are young?

Caterpillar to Butterfly

I am a caterpillar. I have hatched from an egg and I will stay on the leaf and eat it. During this time, I will grow and eventually become a butterfly.
