Project Management	Program Management
A project is a temporary undertaking task to create a unique product or service, and this is managed by project manager.	In Program management multiple projects are maintained to obtain organisational benefits
The tasks include identifying the sponsor, budget allocation, manage the issues and risks and etc.	The tasks include identifying the program sponsors, Manage program scope and change, Transition solution to multiple operations teams
A project typically exists within one team or within an organisational boundary	A program will often cross multiple organizations, and this has an impact on stakeholders, sponsors, funding sources and even assigning the right program manager.
A project manager is primarily responsible for the scope, cost and timeline.	A program manager can recruit all staff for project management office to manage program scope, costs and overall timeline.
Project managers are used to tracking tasks against a project schedule.	Program managers need to track milestones against a program level schedule
Project management usually revolves around a single site	Program management may involve multiple projects.
Project management is more tactical and it mainly focus on the operational elements of the project	Program management is subject to economic, political, and environmental considerations, especially for publicly-traded organizations.
A project manager isn't responsible for delivering quarterly results.	Program managers are often responsible for delivering results tied to the organization's financial calendar.
