

if video HelloWorld variables_1 def main func

```
1
2 #Example file for working with date information
3 #
4
5 from datetime import date
6 from datetime import time
7 from datetime import datetime
8
9 def main():
10     ##DATE OBJECTS
11     # Get today's date from the simple today() method from the
12     today = date.today()
13     print "Today's date is", today
14
15 # print out the date's individual component
16 today=date.today()
17 print "Date Components:", today.day, today.month, today.year
18
19
20
21 if __name__ == "__main__":
22     main()
23
```

today=date.today()
print "Date Components:", today.day, today.month, today.year

Individual date components can also be executed in Python. Here in our code we have mentioned date, month and year separately. The output is printed out as expected

Console x Terminal Problem
terminated> C:\Guru99\date,time and datetime

Date Components: 10 6 2015
Today's date is 2015-06-10
