

A Pie Chart is a circular chart divided into sectors illustrating proportion. A pie chart is one of the most ubiquitous statistical chart in the business world and the mass media. Pie charts can be an effective way of displaying information, in particular if the intent is to compare the size of a slice with a whole pie, rather than comparing slices among them.

Select a pie chart object. By pressing action button you can add or remove slices using corresponding actions. Also it is possible to define your own number of slices. You can also hide / show text labels.

A legend that is represented on the right contains definition of categories that correspond each sector of a pie chart. A cell size is proportional to the font size.

The central angle of each slice is proportional to the size of the corresponding quantity. Together sectors create a full disk.
