Hello, Farai,

I can confirm that this is the default behavior of the widget.

Still, if the Dateinput option is used, the widget should automatically show the min value, but its currently only visually setting the min value and the actual one is still null:

<https://docs.telerik.com/kendo-ui/api/javascript/ui/datetimepicker#configuration-dateInput>

As this is not expected I created an issue in our GitHub repository and forwarded it to our developers for fixing. You can track its progress at:

<https://github.com/telerik/kendo-ui-core/issues/3828>

For a workaround, I can suggest checking the value during the change event and if it is null to programmatically set it to the min value:

<http://dojo.telerik.com/eQoXEY>

Additionally, I updated your Telerik points for bringing this to our attention.

Regards,  
Stefan
