How To Enable 5GHz Wi-Fi On Laptop

Unsaved Word

Connect to a 5GHz Wi-Fi network

There are two things to consider when connecting to a 5GHz wireless network. First, you will need to check if you have a dual band router, this means that the router works on 5GHz and 2.4GHz. You can consult the router manual or log in to the Wi-Fi settings of the router and check if it supports the 5GHz connection.

The second thing to consider is if your laptop is capable of connecting to a 5GHz network. Usually your laptop will have a Wi-Fi adapter, however you will need to confirm if it has the necessary network interface card that supports a 5GHz connection. To do this you will need to perform the steps listed below.

Check laptop for 5GHz support from Command Prompt
