

```
$queryString = '';  
if (isset($components['query'])) {  
    parse_str(html_entity_decode($components['query']), $qs);  
  
    if ($query) {  
        $query = array_replace($qs, $query);  
        $queryString = http_build_query($query, '', '&');  
    } else {  
        $query = $qs;  
        $queryString = $components['query'];  
    }  
} elseif ($query) {  
    $queryString = http_build_query($query, '', '&');  
}  
  
$server['REQUEST_URI'] = $components['path'].('' !== $queryString ? '?' . $queryString : '');  
$server['QUERY_STRING'] = $queryString;  
  
return self::createRequestFromFactory($query, $request, array(), $server);  
}
```

- Sets a callable able to create a Request instance.
- This is mainly useful when you need to override the Request class to keep BC with an existing system. It should not be used for any other purpose.
- `callable|null $callable`
